

Electronic medical dispenser

Our client is one of the world leaders in medication dispensers – both in liquid and powder form. The procedures for dispensing medication have become more and more complex and must allow for the control of prescriptions, the traceability of treatments and patient safety. Electronic features and wireless communications technologies have become increasingly incorporated into dispensing devices in order to meet these market needs. The challenge for Télémaq was to design and create prototypes which would carry out a wide range of electronic functions – in particular controlling dosages and recording doses taken.

Electronic dosage counter

The dispensing of medication in liquid form is carried out using increasingly more technically sophisticated 'dosage pumps'.

Features such as the price of the medication, the control of the prescribed dosage as well as patient safety all contribute to better delivery of medication. In order to achieve this, Télémaq developed, on behalf of a global pharmaceutical group, an extremely reliable electronic dosage counter which could be manufactured cost-effectively.
